                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOTE: This record contains 90 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Contact: sequence_submissions@genome.wi.mit.edu

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG81120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors ontaining them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) fand/or nucleic acids) may then be containing them which are used to produce hosts cells which express the polypeptides may also be used to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the AAH55090 represent specifically claimed S. epidermidis genomic DNA AH55091 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAH55091 to sequence listing of the present specification, however the sequence listing of the SEQ ID NO:4454 so even the sequences are given in the disclosure for SEQ ID NO:4455 to 4472, on sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   260 tittgcgcgatcggacggctgagttgatctggcgccaaaaacctctgctaagtcccgtgc 319

                                                                                                                                                                                                                                                     The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 1 least 15 nucleotides; or (b) a combination of sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 1'-end sequence complementary to a coligonucleotide which comprises a 1'-end sequence of oligonucleotide which represent 1'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers also when the proteins encoded by the full-length cDNAs. The primers also well shall shall seasily without any specialised methods. AAH03166 to AAH13628 and AAB056803 rowresont human cDNA sequences; and anilatest and anilatest and anilatest anilat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

AAH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides (11), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (1) and (11) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (1) may be used to produce the soldermidis polypeptides (11) via the production of vectors ontaining them white aced to produce hosts cells which express the polypeptides (11) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55091 represent specifically claimed S. epidermidis genomic DNA polyuncleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ttttgcgcgatcggacggctgagttgatctggcgccaaaaacctctgctaagtcccgtgc 319

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used in vaccination. The nucleic acids (I) may be used to produce to vaccinate which are used to produce hosts cells which express the polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55099 represent oligonucleotide sequences and primers which are used the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2650 tttattggcaattgacaaccgagttgaacttgggctaatctcaatttcaactctagtcc 2709
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  260 ttttgcgcgatcggacggctgagttgatctggcgccaaaaacctctgctaagtcccgtgc 319

AAH52304 to AAH53970 represent nucleic acids (1) encoding polypeptides (11), given in AAG81454 to AAG8120, from Staphylococcus epidermidis. (1) and (11) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (1) may be used to produce the S. epidermidis polypeptides (11) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (11) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent oliquidis infections, e.g. endocarditis. AAH53971 to polynucleotide sequences from the present invention. AAH55091 to AAH55091 represent oliquide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                           Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

Sequences ABB10381-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides of nucleotides of the invention. Although novel, many of the bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence co potential therapeutic applications. The polypeptides of the invention have biological activities, and hence to premit a transpeutic applications. The polypeptides of the invention may have various activities; including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; chromodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; reaceptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Compositions, e.g., by protein or gene therapy. Such conditions and uncleotides of the invention are useful for preventing, treating or ameliorating medical disorders, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions, e.g., asthma or arthritis), conditions, e.g., by protein or gene therapy. Such conditions and unclearing activities arterial ischaemla, bone disorders (e.g., osteoporosis), and abnormal varelial ischaemla, bone disorders (e.g., osteoporosis), and abnormal varelial or general or metastasis.

Crepair or nucleic acids encoding them) may be used to promote wound replaing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities and beativity may be used to promote variativities and beating to multiper activities and beativity may be used to promote or polyventides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bacterial and fungal infections in addition to immune disorders.

Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAM2566 to AAM99904 encode the human proteins given in AAM2525 to AAM2563. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antiabacterial; endocrine; cardiant; central nervous system; virucide; anti-HIV; fungicide; antimutagen; cardiavascular; antianemalic, antiaggregant; haemostatic; vulnerary; antidlabetic; cytostatic; neuroprotective; antidepressant; noctropic; antidlabetic; cytostatic; neuroprotective; antidepressant; noctropic; antidlabetic; cytostatic; neuroprotective; antidepressant; noctropic; antidlabetic and be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides production, The proteins and polynucleotides are useful for screening for antagonists or antagonists of a protein and for the treatment and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                    antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; antibacterial; endocrine; cardiant; central nervous system; virucide; antiagcegral; endocrine; cardiant; central nervous system; virucide; antiaggregant; haemostatic; vulnerary; antiulcer; osteopathic; eczema; dermatological; antiallergic; antiasthmatic; antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; antiparknosnian; infection; immunostimulant; gene therapy; antisense therapy; vaccine; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; pancreatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cardiac dysfunction, neuropathology; cardiac anaphylaxis; autoimmunity; genetic disease; hematopoietic disorder; platelet disorder; asthma; thrombocytopaenia; osteoporosis; severe combined immunodeficiency; allergic rhinitis; diabetes; multiple sclerosis; depression; Alzheimer's disease; Parkinson's disease; neurodegenerative disorder;

              The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                       system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, auch as alteral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activity, chemoteatic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antinflammatory; antirheumatic; antiarthritic; immunosuppessive; antibacterial; endocrine; cardiant; central nervous system; virucide; antibacterial; endocrine; cardiant; central nervous system; virucide; antiangement; hacmostatic; vulnerary; antiulcer; osteopathic; cezema; dermatological; antiallergic; antiasthmatic; antidiabetic; cytostatic; neuroprotective; antideperssant; nootropic; antiparkinsonian; infection; immunostimulant; gene therapy; anticense therapy; vaccine; inflammation; antianaphylactic; rheumatoid arthritis; septic shock; pancreatitis;

AAH99166 to AAH99904 encode the human proteins given in AAM25225 to
AAW25963. The proteins can have activities based on the tissues and
cells they are expressed in, such as: antinifammatory; antinheumatic;
central nervous system; virucide; antibacterial; endocrine; cardiant;
cardiovascular; antianaemic; antiagegrapht; hemostatic; vulnerary;
antiulcer; osteopathic; dermatological; antiallergic; antiasthmatic;
antidabetic; cytostatic; neuroprotective; antidepressant; noctropic;
antidaphetic; cytostatic; neuroprotective; antidepressant; noctropic;
antidaphetic; cytostatic; neuroprotective; antidepressant; noctropic;
conduction, The proteins and polynucleotides are useful for screening for agonits or antagonists of a protein and for the treatment and diagnosis;
cf disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac daysfunction, infections, autoimmunity, genetic diseases, haematopoletic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, cancer, multiple sclenosis, depression, alloring and platelet, mannade in munodeficiency, eczema, allergic
chinitis, asthma, diabetes, cancer, multiple sclenosis, depression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytokine; cell proliferation; cell differentiation; growth factor; haematopoiesis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoietic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; attenosclerosis; oronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antihifammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vascuropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss.

Tang YT, Liu C, Drmanac RT;

WPI; 2001-457740/49. P-PSDB; ABB11552 Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -

Claim 1; Page 586-587; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The sequences ABA08255-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the nucleotides.

CC antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; including cytokine, cell proliferation or cell differentiation activities; including cytokine, cell proliferation or cell immunomodulatory activity; activit, tissue growth activities, chemotactic or chemokinetic activities; haemostatic, thrombotic or chemotactic or chemokinetic activities; haemostatic, thrombotic or chemotactic activities; nacer cell proliferation or metastasis.

CC chemotactic or themokinetic activities; haemostatic, thrombotic or thrombotic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

CC involved in oncogenesis, cancer cell proliferation or metastasis.

CC conditions, e.g., by protein or gene therapy. Such conditions (e.g., asthma or arthritis), dispendences, haematopoietic disorders (e.g., mayeloid or lymphoid cell disorders, conditions, cell proliferation and conditions, cell or or proliferative retinopathy, atheroscilerosis, coronary heart disease, conditions, cell prowth, atheroscilerosis, coronary heart disease, cepair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcrs), while those with leading (e.g., of burns, incisions and ulcrs), while those with langulates stem cells growth. Polypeptides may be used to augment autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.

The invention relates to evaluating strain variation within and between different populations of the tuberculosis bacterial pathogen, Mycobacterium tuberculosis or related Mycobacterium by determining the nucleotide sequence of the first strain at positions in the complete sequence of the genome that correspond to positions that differ in the nucleotide sequences of M. tuberculosis strains CDC 1551 (AAI99683) and H37Rv (AAI99682). The method is useful for evaluating strain variation of M. tuberculosis and has valuable application in the fields of Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6294328Bl.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                              Yamamoto J;

the specification. The primer sets can be used in antisense therapy and the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNas. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNas. The primers allow obtaining of the full-length cDNas easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13612 represent human cDNa sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH3612

; 0

represent oligonucleotides, all of which are used in the exemplification

Sequence 2497 BP; 732 A; 522 C; 617 G; 626 T; 0 other;

of the present invention.

Gemini virus DNA fragment stem loop.

The new CFDV DNA fragment is useful as a bacterial or yeast promoter, as a promoter for tissue-specific (especially phloem-specific) gene expression in plants and for production of chimeric constructs for transient or stable expression. Certain fragments of CFDV DNA have stronger promoter activity in E. coli than the CaMV 355 promoter.
Stem loop; coconut foliar decay virus; CFDV; bacterial promoter;
yeast promoter; tissue-specific; phloem-specific; CaMV 35S promoter; ss.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosphila Genome Project (BDGP).
The BDGP is constructing a physical map of the prosophila melanogaster genome using these BACs. For further information pleases see http://www.fruitfly.org The BDGP Drosphila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Dias Neto, E., Garcia Correa, R., Verjovski-Almeida, S., Briones, M.R., Magal, M.A., da Silva, W.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10.5 Kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil47321141gblAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AL442127 210115 bp DNA linear PRI 26-JAN-2001

requests: clonerequest@sanger.ac.uk
on Jan 28, 2001 this sequence version replaced gi:12578234.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
